

BIPIN PAUDEL

Backend Developer | Java | Spring Boot

Pokhara, Nepal — relocating to Kathmandu • +977 9827173294 • paudelbipin05@gmail.com • [GitHub](#) • [LinkedIn](#)

SUMMARY

Backend developer working in Java and Spring Boot. Built and deployed a clinic management platform — 76 REST endpoints across 13 JPA entities, two payment gateways, running as a containerised service against managed PostgreSQL and Redis — alongside internship work building and debugging production services at a food-delivery company. Graduating December 2026 (BSc Hons, London Metropolitan University); available full-time immediately and relocating to Kathmandu.

TECHNICAL SKILLS

Languages: Java, SQL, TypeScript

Backend: Spring Boot, Spring Security, Spring Data JPA, Hibernate, Spring WebFlux, REST APIs, JWT, OAuth2, JavaMailSender, Lombok

Data & Caching: PostgreSQL, MySQL, Redis, Flyway

Testing: JUnit 5, Testcontainers, WireMock, MockMvc

Infrastructure: Docker (multi-stage builds), Render, Neon, Redis Cloud

Tools: Git, GitHub, Bitbucket, Maven, Postman, Swagger/OpenAPI, IntelliJ IDEA

Familiar: React, Angular

PROJECTS

Cura — Clinic Management System | [GitHub](#) | [Live](#)

Java 21, Spring Boot 4, Spring Security, JWT, OAuth2, Spring Data JPA/Hibernate, Spring WebFlux, PostgreSQL, Redis, Flyway, Docker

- Deployed the service as a multi-stage Docker build on Render against managed PostgreSQL and Redis, with Flyway-versioned schema migrations and springdoc/OpenAPI documentation covering all 76 endpoints
- Built a clinic management backend exposing 76 REST endpoints over 13 JPA entities for four user roles (admin, doctor, receptionist, patient), covering doctor schedules and leave, slot-based booking with conflict handling, walk-in and receptionist-booked flows, prescriptions, and scheduled jobs for appointment auto-cancellation and reminders
- Implemented stateless authentication issuing JWTs in HttpOnly cookies alongside Google OAuth2 login, with role-scoped URL authorization enforced in the Spring Security filter chain
- Integrated Khalti and eSewa payment gateways behind a Strategy and Factory design, issuing outbound provider calls through Spring WebFlux with HMAC-SHA256 request signing, server-side transaction verification, and callback handling for two structurally different provider flows
- Cut repeated database reads by caching doctor profiles, medical records, and photo lookups in Redis using TTL expiry combined with event-driven eviction, and covered the payment and account-reactivation flows with 23 tests driving a containerised PostgreSQL through Testcontainers, WireMock, and MockMvc

VoiceOver — Text-to-Speech REST API | [GitHub](#)

Java 17, Spring Boot, RestTemplate, Multipart File Handling, ElevenLabs API

- Built a REST API that converts plain text or uploaded text files into MP3 audio, reading multipart uploads through a buffered input stream and integrating the ElevenLabs TTS API over HTTP using RestTemplate
- Returned generated audio as a downloadable MP3 through `ResponseEntity<Resource>`, setting `audio/mpeg` content type and `Content-Disposition` attachment headers, and isolated external API failures behind custom exceptions (`ExternalApiError`, `InvalidFileException`)

WeatherHub — Secure Email Notification & Weather Broadcast Backend | [GitHub](#)

Java 17, Spring Boot, Spring Security, JWT, OAuth2, Spring Data JPA, PostgreSQL, Redis, JavaMailSender

- Built stateless JWT and OAuth2 authentication with role-based access control (USER / ADMIN), and cache-first broadcast logic that serves weather data from Redis when present, otherwise fetches from an external API and caches it under a configurable TTL, then broadcasts weather-enriched emails to all registered users via JavaMailSender

EXPERIENCE

Software Developer Intern — Foodmood Pvt. Ltd., Pokhara

Mar 2026 – May 2026 • Spring Boot, Angular, MySQL, Bitbucket

- Built an asynchronous email queue and scheduler in Spring Boot, decoupling transactional email delivery from request handling so API responses no longer blocked on outbound mail
- Diagnosed a production duplicate-email defect by tracing the send pipeline end to end, isolating a redundant `update()` call in the scheduler that re-queued messages already marked as sent
- Resolved a `StackOverflowError` caused by recursive `toString()` on bidirectional JPA associations, and corrected cascade types and `@DynamicUpdate` behaviour on the affected entities
- Developed REST endpoints and Angular components across the stack against MySQL schemas, working in a senior-reviewed Bitbucket pull request workflow

EDUCATION

BSc (Hons) Computing — London Metropolitan University

Informatics College Pokhara | Expected December 2026
